

Winter Update

- The Nutrient Management Regulation requires that golf courses and driving ranges submit their Nutrient Management Plan for the 2026 season at least 14 days prior to fertilization. Soil samples should be collected before winter in order to be completed by spring and used in making the plan. The template as well as additional instructions to assist you when completing your Nutrient Management Plan are available [here](#).
- The Pest Management Regulatory Agency provides [an online tool](#) for Superintendents to search for label information of common products used on golf courses.
- Here is the [link to the Q2 Research Report](#) from the ATRF highlighting some of their ongoing projects into this fall/winter.

We hope our turf colleagues and friends have a safe and enjoyable winter!
